

NCIE-002 v0.4 → v0.5

Surgical Amendment Change Register

VPF & Dynamic Agent Synthesis Architectural Consistency Amendment — IN DEVELOPMENT / FOR HUMAN REVIEW

Authorities: Approved NCIE-001 — Master PRD v1.3, and approved NCIE-007 — AI, Agent & Model Orchestration Specification v1.1. The existing 32-chapter structure is unchanged; no chapter was added, removed or renumbered.

Amendment ID	Chapter/Section	Existing Architecture	Amendment	Authority	Reason	Status
AM-1	Ch.1 §1.2, new §1.3.6	AI platform named only as a single scope item; no AI/agent governing-invariants subsection.	Expanded the §1.2 AI-platform mention to name its sub-components (ARGUS, Model Gateway, Tool Gateway, Context/Memory Services, Evaluation/Guardrail Services, Agent Factory, Ephemeral Agent Runtime, VPF, Agent/VPF Profile Registries); added new §1.3.6 listing the 7 new AI/Agent governing invariants.	NCIE-007 v1.1 front matter §0.3	The reference architecture omitted the approved Dynamic Agent and VPF capability.	APPLIED
AM-2	Ch.19 §19.2 (table row), new §19.2A, §19.7, §19.8	ARGUS orchestration architecture (Model Gateway, Tool Gateway, Grounding, Authorization Filtering, No Elevated Access) did not recognize agent discovery or Dynamic Agent Synthesis.	Added a Principal Components row and new §19.2A describing ARGUS's 5-step consumption of Registered/Ephemeral agents; added a Security Controls bullet (no elevated access via synthesis) and a Failure Modes bullet (Agent Factory/VPF unavailable).	NCIE-007 v1.1 Ch.11 §11.3, §11.9	ARGUS's orchestration boundary needed to recognize the approved Dynamic Agent Synthesis capability without becoming its detailed lifecycle chapter.	APPLIED
AM-3	Ch.20 new §20.3A, §20.13	Collaborative roles described generically as 'NCIE' participation; no agent-realization statement.	Added §20.3A stating collaborative roles may be realized via Registered or Ephemeral Synthesized Agents, remaining subordinate; added one bullet to the §20.13 cross-chapter invariants list.	NCIE-007 v1.1 Ch.15	Minor consistency amendment only, per directive §6.	APPLIED

AM-4	Ch.24 §24.2 (table rows), new §24.4A (principal amendment) , §24.9, §24.11	AI Platform architecture covered Model Gateway, Context Builder, Guardrails, Model Registry, Evaluation Harness and the v0.4 collaborative-evaluation components only.	Added 4 new component rows; inserted new §24.4A with 10 numbered sub-sections (Agent Factory, Agent Registry/Capability Registry, Ephemeral Agent Runtime, VPF, Gate A, Gate B, VPF Profile Registry, Control Plane/Execution Plane with a relationship diagram, 3 architectural flow diagrams, and a Gateway/Memory/Authority/Recursion preservation section); added 3 Failure Modes bullets and 1 Acceptance Criteria bullet.	NCIE-001 v1.3 §12.80A, §18.241A; NCIE-007 v1.1 Ch.11, Ch.12, Ch.26	The principal architectural amendment — Chapter 24 is the AI Platform chapter and had no logical home for Agent Factory, Ephemeral Agent Runtime, VPF or the Control/Execution Plane boundary.	APPLI ED
AM-5	Ch.28 §28.3 (table rows), §28.9	Dependency Degradation Matrix covered AI/Model Gateway, RPA, Mapping and single-source loss only.	Added 4 new degradation-matrix rows (Agent Factory, Ephemeral Agent Runtime, VPF, Registry unavailable) and 1 Acceptance Criteria bullet (simulated VPF outage).	NCIE-007 v1.1 Ch.32	The new AI orchestration components needed explicit degraded-mode behavior, including the VPF-FAILURE-SHALL-NOT-FAIL-OPEN invariant.	APPLI ED
AM-6	Ch.31 new §31.3A, §31.3B	Test layers and RTM structure did not name Dynamic Agent Synthesis or VPF acceptance criteria.	Added §31.3A (14 testable architecture-level acceptance scenarios) and §31.3B (the mandatory Human-Primary adversarial scenario).	NCIE-007 v1.1 Ch.32	Architecture-level acceptance scenarios were required per directive §17-18.	APPLI ED
AM-7	Ch.32 new §32.4A	Handover Contents listed baseline documentation/runbook/backlog items only.	Added §32.4A listing 14 required engineering deliverables (Agent Factory, Agent Definition implementation, Ephemeral Agent Runtime, Agent Registry integration, VPF runtime, VPF Profile Registry integration, Gate A, Gate B, Sandbox/Evaluation, Runtime-policy enforcement, Agent expiry, Kill/Suspend controls, Provenance, Observability) and the Codex runtime-boundary statement; added 1 Acceptance	NCIE-001 v1.3 §18.241A; NCIE-007 v1.1 Ch.36 §36.7-§36.8	The Codex/implementation handover needed to name the new engineering deliverables explicitly.	APPLI ED

Criteria bullet.

AM-DOC	Document Governance / Cover / New §1.8	Cover showed Version 0.4, Production-ready.	Cover updated to Version 0.5, IN DEVELOPMENT / FOR HUMAN REVIEW OF SURGICAL AMENDMENT; added §1.8 Document Amendment History preserving the v0.4 baseline record.	Administrative (directive §22)	Required change-control record.	APPLIED
--------	--	---	---	--------------------------------	---------------------------------	---------

Traceability Convention

Every new/modified requirement traces to NCIE-001 v1.3 (§12.77-§12.80A, §18.241A) and/or NCIE-007 v1.1, using each chapter's existing Traceability line — no new or competing traceability scheme was introduced.

Additional Consistency Amendments Found (Directive §25 Search)

A full-document keyword search for the nine listed stale-statement patterns (registered-agents-only; bespoke-Codex-required; ARGUS-cannot-request-synthesis; AI-output-bypasses-VPF; VPF-as-approval; arbitrary-provider-access; direct-consequential-system-access; self-registering synthesized agents; Agent-Factory-failure-disables-deterministic-NCIE) found 22 matches, all originating from this amendment's own new content correctly stating the non-contradictory architecture (e.g. 'AGENT SYNTHESIS ≠ SELF-REGISTRATION', 'never AGENT → ARBITRARY PROVIDER'). No pre-existing stale or contradicting statement was found. No additional surgical consistency amendment was required.
